

In the Claims:

Please cancel claims 1 to 19 without prejudice and add the following claims 20 to 49:

Claims 1 to 19.(canceled)

20.(new) A packaging system for in-situ preparation of a formulation from at least two constituents, in which said at least two constituents are separately stored until said formulation is prepared, wherein said packaging system comprises at least two separate storage chambers for storing said at least two constituents separately and at least one static micromixer for mixing said at least two constituents to prepare the formulation;

wherein said at least one static micromixer comprises at least one component in the form of a disk (1);

wherein said disk (1) is provided with at least one inlet opening (2) disposed in a plane of said disk for introduction of at least one feed stream into a linking channel (3) and with at least one outlet opening (4) disposed in the plane of said disk for outflow of the feed stream into a mixing zone (5), said at least one inlet opening (2) being connected with said at least one outlet opening (4) in a communicating manner via said linking channel (3) which is disposed in the plane of said disk; and

wherein said linking channel (3) is divided by microstructure units (6) into two or more part channels (7) before opening into the mixing zone (5), and each

of the part channels has a respective width in a millimeter to sub-millimeter range and said width is smaller than a width of the mixing zone (5).

21.(new) The packaging system as defined in claim 20, wherein the static micromixer comprises a system for conveying the constituents that are kept separated until preparation of the formulation and the static micromixer comprises a housing (11) with at least two feed stream inlets (12a) for introduction of respective feeds to be mixed and with at least one product stream outlet (16) for a product stream.

22.(new) The packaging system as defined in claim 21, wherein the static micromixer comprises a plurality of said disks (1) arranged in a stack in which said disks are superposed over each other so that subsidiary channels communicating with said at least two feed stream inlets (12a) are formed by said at least one inlet opening (2) of each of said disks and the mixing zones (5) of said disks together form a main channel connected with the at least one product stream outlet (16) for carrying away a mixed product, and wherein the main channel and the subsidiary channels extend through said stack of said disks.

23.(new) The packaging system as defined in claim 20, wherein the width of each of the part channels (7) is from 1 μm to 2 mm at an opening thereof into said mixing zone (5);

and/or a ratio of a largest width of the linking channel (3) and/or a width of the at least one inlet opening (2) to the width of each of the part channels (7) is greater than 2;

and/or a ratio of a length of each of the part channels (7) to the width of each of the part channels (7) is from 1 : 1 to 20 : 1;

and/or a ratio of the width of the mixing zone (5) to the width of each of the part channels (7) is greater than 2.

24.(new) The packaging system as defined in claim 20, wherein the at least one disk (1) additionally has at least one flow-through opening (9).

25.(new) The packaging system as defined in claim 24, wherein said at least one inlet opening (2), said at least one flow-through opening (9) or said mixing zone (5) is enclosed by the plane of said disk, and the linking channel (3) is formed by an indentation in said disk.

26.(new) The packaging system as defined in claim 24, wherein said at least one inlet opening (2), said at least one flow-through opening (9) or said mixing zone (5) is arranged at an edge of said disk or as a recess in an edge of said disk.

27.(new) The packaging system as defined in claim 20, wherein said at least one inlet opening (2) of said disk (1) comprises respective inlet openings for

corresponding fluid streams, and said respective inlet openings are connected by corresponding linking channels (3) with said mixing zone (5).

28.(new) The packaging system as defined in claim 20, wherein said at least one outlet opening (4) comprises respective outlet openings arranged on a circular line.

29.(new) The packaging system as defined in claim 20, wherein said disk (1) is provided with additional through-going openings (12) and with additional part channels (13) that are integrated into the microstructure units (6) and separated from the part channels (7).

30.(new) The packaging system as defined in claim 22, wherein either the linking channels (3) of the disks (1) in said stack are formed by indentations in the disks and the linking channels (3) are divided by said microstructure units (6) disposed in the disks (1) into said part channels (7) prior to opening into the mixing zone (5), or the linking channels (3) of the disks (1) are formed by recesses in the disks (1) of said stack, the disks are arranged as intermediate disks between a cover disk and a bottom disk, and the linking channels (3) are divided into said part channels (7) by said microstructure units (6) disposed on the cover disks and/or bottom disks prior to opening into the mixing zone (5).

31.(new) The packaging system as defined in claim 20, wherein the mixing zone (5) is filled by a molded element that closes off said at least one outlet opening (4) in an idle state, and said molded element is entirely or partly removed from the mixing zone (5) during operation, thereby entirely or partly opening the at least one outlet opening (4).

32.(new) An in-situ method of preparing a formulation from at least two constituents prior to use of the formulation, said method comprising the steps of:

- a) providing a packaging system comprising at least two separate storage chambers for separately storing said at least two constituents and at least one static micromixer for mixing said at least two constituents to prepare said formulation;

- b) storing said at least two constituents separately in said at least two separate storage chambers until immediately prior to the mixing; and

- c) mixing the at least two constituents to form the formulation immediately by means of the at least one static micromixer;

wherein said at least one static micromixer is provided with at least one component in the form of at least one disk (1); wherein said disk (1) is provided with at least one inlet opening (2) disposed in a plane of said disk for introduction of at least one feed stream into a linking channel (3) and with at least one outlet opening (4) disposed in the plane of said disk for outflow of the at least one feed stream into a mixing zone (5), said at least one inlet opening (2) being connected with said at least one outlet opening (4) in a communicating manner via said

linking channel (3) which is disposed in the plane of said disk; and wherein said linking channel (3) is divided into two or more part channels (7) by microstructure units (6) before opening into the mixing zone (5), and each of the part channels (7) has a respective width in a millimeter to sub-millimeter range that is smaller than a width of the mixing zone (5).

33.(new) The method as defined in claim 32, wherein the at least one feed stream has a flow rate into the mixing zone (5) that is greater than a flow rate of a product stream within the mixing zone (5).

34.(new) The method as defined in claim 32, wherein the formulation is a microemulsion or a nanoemulsion.

35.(new) The method as defined in claim 32, wherein the static micromixer comprises a system for conveying the constituents that are kept separated until preparation of the formulation and the static micromixer comprises a housing (11) with at least two feed stream inlets (12a) for introduction of respective feeds to be mixed and with at least one product stream outlet (16) for a product stream.

36.(new) The method as defined in claim 35, wherein the static micromixer comprises a plurality of said disks (1) arranged in a stack in which said disks are superposed over each other so that subsidiary channels communicating with said at least two feed stream inlets (12a) are formed by said at least one inlet opening

(2) of each of said disks and the mixing zones (5) of said disks together form a main channel connected with the at least one product stream outlet (16) for carrying away a mixed product, and wherein the main channel and the subsidiary channels extend through said stack of said disks.

37.(new) The method as defined in claim 32, wherein the width of each of the part channels (7) is from 1 μ m to 2 mm at an opening thereof into said mixing zone (5);
and/or a ratio of a largest width of the linking channel (3) and/or a width of the at least one inlet opening (2) to the width of each of the part channels (7) is greater than 2;
and/or a ratio of a length of each of the part channels (7) to the width of each of the part channels (7) is from 1 : 1 to 20 : 1;
and/or a ratio of the width of the mixing zone (5) to the width of each of the part channels (7) is greater than 2.

38.(new) The method as defined in claim 32, wherein the at least one disk (1) additionally has at least one flow-through opening (9).

39.(new) The method as defined in claim 38, wherein said at least one inlet opening (2), said at least one flow-through opening (9) or said mixing zone (5) is enclosed by the plane of said disk, and the linking channel (3) is formed by an indentation in said disk.

40.(new) The method as defined in claim 38, wherein said at least one inlet opening (2), said at least one flow-through opening (9) or said mixing zone (5) is arranged at an edge of said disk or as a recess in an edge of said disk.

41.(new) The method as defined in claim 32, wherein said at least one inlet opening (2) of said disk (1) comprises respective inlet openings for corresponding fluid streams, and said respective inlet openings are connected by corresponding linking channels (3) with said mixing zone (5).

42.(new) The method as defined in claim 32, wherein said at least one outlet opening (4) comprises respective outlet openings arranged on a circular line.

43.(new) The method as defined in claim 32, wherein said disk (1) is provided with additional through-going openings (12) and with additional part channels (13) that are integrated into the microstructure units (6) and separated from the part channels (7).

44.(new) The method as defined in claim 34, wherein either the linking channels (3) of the disks (1) in said stack are formed by indentations in the disks and the linking channels (3) are divided by said microstructure units (6) disposed in the disks (1) into said part channels (7) prior to opening into the mixing zone (5), or the linking channels (3) of the disks (1) are formed by recesses in the disks (1) of

said stack, the disks are arranged as intermediate disks between a cover disk and a bottom disk, and the linking channels (3) are divided into said part channels (7) by said microstructure units (6) disposed on the cover disks and/or bottom disks prior to opening into the mixing zone (5).

45.(new) The method as defined in claim 32, wherein the mixing zone (5) is filled by a molded element that closes off said at least one outlet opening (4) in an idle state, and said molded element is entirely or partly removed from the mixing zone (5) during operation, thereby entirely or partly opening the at least one outlet opening (4).

46.(new) The method as defined in claim 32, wherein one of the at least two constituents is a single aqueous liquid phase and the other is a single hydrophobic liquid phase or a liquid phase containing a water-sensitive substance; or the at least two constituents comprise substances that react chemically or physically modify mixture consistence when coming into contact with each other.

47.(new) The method as defined in claim 32, wherein said formulation is at least one member selected from the group consisting of colorants, adhesives, foodstuffs, pharmaceutical agents, cosmetic agents, building materials, cleaning agents.

48.(new) The method as defined in claim 32, wherein said formulation is an emulsion-forming preparation and wherein said emulsion-forming preparation contains at least one hair-care active constituent, at least one skin-care cosmetic active constituent, at least one dermatological or pharmaceutical active constituent, hair-firming agent, at least one hair colorant or at least one permanent wave agent.

49.(new) A static micromixer for mixing two or more constituents to form a mixture immediately prior to use of the mixture, said static micromixer comprising at least one component in the form of a disk (1), and

wherein said disk (1) is provided with at least one inlet opening (2) disposed in a plane of said disk for introduction of at least one feed stream into a linking channel (3) and with at least one outlet opening (4) disposed in the plane of said disk for outflow of the at least one feed stream into a mixing zone (5), said at least one inlet opening (2) is connected with said at least one outlet opening (4) in a communicating manner via said linking channel (3) which is disposed in the plane of said disk; and

wherein said linking channel (3) is divided by microstructure units (6) into two or more part channels (7) before opening into the mixing zone (5), and each of the part channels (7) has a respective width in a millimeter to sub-millimeter range that is smaller than a width of the mixing zone (5).
